

**EP. 1**

# **JAVA INTERVIEW**

**By Ashay Nayak**

*Hi Priya! I am Ashay.  
I am going to take  
your technical round.*

*Hey Ashay! Thanks  
for giving me this  
oppportunity.*

*I am going to ask  
few Java Questions.*

*okay.*

*Can we Overload or  
Override static  
methods in java?*

*We can overload  
static methods but we  
can't override static  
methods.*

*Can you elaborate?*

*Sure. We can overload as we can have two or more static methods with the same name and different arguments.*

*But, overriding static methods doesn't work because method overriding is based on dynamic binding at runtime and the static methods are bonded using static binding at compile time. However, program gets executed successfully. It's just overriding static method doesn't override the method.*

*hmmm...*

# EXAMPLE

Overload ✓

```
class Task
{
    public static void getInfo()
    {
        System.out.println("Info of all students");
    }

    public static void getInfo(String name)
    {
        System.out.println("Info of student whose name is "+name);
    }

    public static void main (String[] args)
    {
        Task.getInfo();
        Task.getInfo("Ashay");
    }
}
```

Output:

Info of all students

Info of student whose name is Ashay

# EXAMPLE

Override *X*

```
class Parent {
    static void print()
    {
        System.out.println("Parent");
    }
}
class Child extends Parent
{
    static void print()
    {
        System.out.println("Child");
    }
}

class Task
{
    public static void main (String[] args)
    {
        Parent obj = new Child();
        obj.print();
    }
}
```

Output:

Parent

// without static output will be "Child" as print() method gets overridden
